

Scala Debugging Questions

Intermediate Level (10)

Q1

Find the error.

```
val x: Int = "10"  
println(x + 5)
```

#"10" its should be 10

Q2

Identify issue.

```
var total = 0
```

```
for(i <- 1 to 5){  
  total += i  
}
```

```
println(total)
```

Expected result should be **sum of numbers**.

#total+=i

Q3

```
val list = List(1,2,3,4)
```

```
list.foreach(x =>  
  println(x)  
  println(x*2)  
)
```

Why only first print works?

#Because of not using the { }

Q4

```
val numbers = List(1,2,3)

val result = numbers.map(x => x*2)

println(numbers)
```

Why result is not printed?

#Printing numbers instead of result

Q5

```
def add(a:Int,b:Int)// here we need to add return type as =
{
a+b
}

println(add(5,10))
```

Why compiler error occurs?

#no =to assign the return type and value

Q6

```
val data = Map("a"->1,"b"->2)

println(data("c"))
```

Why runtime error occurs?

#Because there is no key-c

Q7

```
var x = 5

if(x = 10){
println("Equal")
}
```

Find the mistake.

#no == instead used =

Q8

```
val list = List(1,2,3)
```

```
list.map(x => println(x))
```

Why map is not ideal here?

#Here we use foreach loop to print elements, maps function is to map the elements but here mapping of elements willnot work as printing is done

Q9

```
def greet(name:String){  
  println("Hello "+name)  
}
```

```
greet()
```

What is the error?

#No arguments given

Q10

```
val list = List(1,2,3)
```

```
for(i <- list)  
  println(i)  
  println("Done")
```

Why only one statement inside loop?

#beacuse not using { }

Advanced Debugging Questions (5)

Q11

```
class Person(name:String){  
  println(name)  
}
```

```
val p = new Person
```

Why compilation fails?

#No argument passed when creating the object

Q12

```
class User{  
  private var age:Int = 0  
}
```

```
val u = new User  
println(u.age)
```

Why error occurs?

#age is a private variable so it can only be accessed with getter method

Q13

```
object Test{  
  def main(args:Array[String]){  
    println("Hello")  
  }  
}
```

Why program may not run properly in Scala 3 environments?

#missing return type and syntax expectations(=)

Q14

```
class A{  
  def show(){  
    println("A")  
  }  
}
```

```
class B extends A{  
  def show(){  
    println("B")  
  }  
}
```

What concept is used and what improvement needed?

#polymorphism

Q15

```
object Config{  
  var url="localhost"  
}
```

```
class Service{  
  val url="production"  
  println(Config.url)  
}
```

Why incorrect value printed?

This happens because two different variables named url exist in different scopes.
