

Git

What are the different approaches to operate a github account?

- through github,gitbash
- ~through command prompt and console

Introduction to git

Git is a distributed version control system used to track changes in source code during software development

It helps developers:

- track file changes
- collabrate with teams
- maintain version history
- manage branches

Configure git-git config user.name "Anvin P J"
git config user.email"[yourmail.com](#)"

Create folder =mkdir folder name

Change directory -cd foldername

Initialize git repository

git init

Step 1 create a file

touch [filename.py](#) (in bash)

Step 2 add file to staging area

git add [app.py](#)

Or add file all files

git add .

Step 3 commit changes

git commit -m "intial commit"

git log -to check history

Create a remote repository

Remote repositories are in platform:

~github

~gitlab

~bitbucket

Steps:

1.login to github

2.new repository

3.enter name

4.create

Copy repo link

Push to a remote repository

Connect to local repo to remote

git remote add origin url.git

Check remote:

Git remote -v

Push code

git push -u origin main

Git reference (important commands)

git status-check current status

git add - add file to staging

git commit-save changes

git log - view commit history

git dif -view file changes

git branch - List branches

git checkout - switch branch

git merge- merge branches

Branching and merging

Branching allows to parallel development without affecting main code.

Create new branch:

git branch feature1

Switch to branch:

git checkout feature1 or git checkout -b feature1(create and switch)

Merge branch to main:

Switch to main branch

git checkout main/master

Merge :git merge feature1

Delete Branch

Git branch -d feature1

Basic git workflow

Working directory

+

Staging area(git add)

+

Local repo(git commit)

+

Remote Repository(git push)
